

Cleya.ai Bug Report

Cleya.ai — Bug Report

Website: <https://cleya.ai/>

Date: 30 March 2026 | Total Bugs: 15

Bug #1: Company Stage Dropdown — Options Not Visible

When the 'Company Stage' dropdown is opened, the options list appears blank. The option texts are not visible (likely white text on white background, or options not rendering at all).

COMPANY NAME *

Intellact AI

COMPANY STAGE *

Select...

Select...

What does your company do? Who are your customers?

Bug #1 — Dropdown options not visible in Company Stage field

Bug #2: 'Other' Option in Industries — No Popup/Input Appears

In the 'Industries You Work In' section, clicking the 'Other' option does not trigger any popup or text input field. The user should be able to type a custom industry, but nothing happens on click.

INDUSTRIES YOU WORK IN *

AI / ML SaaS Fintech

Other

WHERE ARE YOU BASED? *

e.g. Bangalore, India

Bug #2 — 'Other' button does not open any input field

Bug #3: Profile Completion Stuck at 88%

The profile completion progress bar is stuck at 88% even after filling in all visible details. It is unclear which fields account for the remaining 12%, suggesting a miscalculation in the progress logic or unmapped required fields.

C Cleya.ai Matches 3

 **Co-founder** Founder

AI-powered automations and systems
Intellact AI · Gurugram, India

88% complete

 TOTAL MATCHES

 PENDING REVIEW

Bug #3 — Profile shows 88% complete with no indication of missing fields

Bug #4: Match Recommendations Not Hyper-Niched / Irrelevant Results

The match recommendations are not relevant to the user's stated needs. When the user selected a preference for someone to help boost marketing, the system recommended partners in the AI space and investors instead. This is likely due to a small dataset or the matching algorithm not filtering accurately based on the user's specific goals.

Bug #5: Matches Not Sorted by Fit Percentage (Descending Order)

The matches are not sorted by fit percentage in descending order. The highest 'Possible Fit' match should appear first, followed by lower ones. Currently the ordering appears random (e.g., 33% appearing after 31% rather than being sorted highest to lowest).

Bug #6: Pending Count Mismatch & No Request State Tracking

Two issues found on the 'Your Matches' page:

- Counter mismatch: After clicking 'Connect', the Pending count shows 0 on the 'Your Matches' page but the Dashboard shows 3 pending. The count is inconsistent across screens.
- No request state tracking: There is no proper acknowledgement of the request's current status. Suggested stages such as 'Request Sent → Viewed → Accepted/Rejected' are missing, leaving the user with no visibility into where their connection request stands.

Bug #6 — Pending(0) on Matches page while Dashboard shows 3 pending

Bug #7: 'Why Connect' Description is Vague — Missing Profile Details

The 'Why Connect' description is too generic and does not provide sufficient relevant information about the connection's background. Key details such as companies they have worked at, funded, or been associated with should be visible — ideally auto-scraped from LinkedIn — to help the user make a more informed decision before connecting.

Bug #8: Chat with Cleya — Broken Markdown Formatting

The 'Chat with Cleya' AI assistant response displays raw markdown syntax (e.g., ****bold****) as plain text instead of rendering it properly. This makes the response appear cluttered and hard to read.

Bug #8 — Raw markdown symbols visible in Cleya chat response

Bug #9: Lengthy Onboarding Forms — No LinkedIn/CV Import Option

Multiple UX and product-level issues identified:

- Lengthy onboarding forms: The forms are too long and tedious. A user who discovered the platform randomly may drop off before completing them.
- No auto-fill from LinkedIn/CV: There is no option to import profile data from LinkedIn or upload a CV to auto-populate form fields, which would significantly reduce friction.

- Low quality leads: Currently unable to connect with high-quality leads, likely due to a small user base. The core value proposition depends on the quality of matches — if that is not strong, retention will suffer.

Bug #10: Match Card Shows Insufficient Information

The information shown on the match card is too minimal to make an informed decision. Just a title, company name, and a one-liner 'Why Connect' description is not enough. Users need more context such as the person's background, experience, past companies, achievements, or portfolio to judge whether it's worth their time to connect.

Bug #10 — Match card with insufficient profile information

Bug #11: Generic AI-Generated Design — Lack of Unique Branding

The website has a generic AI-generated visual design. The branding and visual identity lack uniqueness and creativity, making it look similar to countless other AI-built websites. At minimum, the branding (colors, typography, visual language) should be distinctive and tailored, even if the overall layout follows standard conventions.

Bug #12: Onboarding Chat Flow Dead-End After 'How Did You Hear About Cleya?'

The onboarding chat flow gets stuck after the user answers 'How did you hear about Cleya.ai?' — there is no next step, confirmation, or transition to the dashboard or matches page. The user is left with no feedback on what happens next, creating a dead-end experience with no clear call to action or progress indicator.

Bug #13: LinkedIn URL Field — 'https://' Not Pre-filled

The LinkedIn URL input field expects the full URL including 'https://' to be typed manually by the user. The 'https://linkedin.com/in/' prefix should be pre-filled in the input field so the user only needs to enter their unique handle — reducing friction and chances of input errors.

Bug #14: Matching Algorithm Relies on Limited Data — Needs LinkedIn Crawling

The matching algorithm relies on limited self-reported data, making truly relevant matches coincidental rather than intentional. A more robust approach would involve LinkedIn crawlers and reasoning-based search (using tools like Olostep or Firecrawl) to proactively source and match relevant profiles — similar to candidate sourcing agents. However, the use case here is more nuanced than hiring, so the crawling logic and matching reasoning would need to be carefully tailored to the platform's purpose.

Bug #15: Multiple UI/Navigation Issues

Several UI and navigation-level issues observed across the platform:

- Incomplete Hindi translation: When the language is toggled to Hindi, some content remains in English and is not properly translated.
- No footer after login: The logged-in view of the site is missing a footer entirely.
- Inconsistent Navbar: The navbar lacks proper arrangement, and several inner pages (e.g., Introductions, Chat) are missing navbar links, leaving users without easy navigation.
- No chat history: The 'Chat with Cleya' feature does not store or display previous conversation history. Each session starts fresh with no context from prior chats.

Bug #15 — Dashboard view

Bug #15 — Navbar on inner pages

Bug #15 — Introductions page with no content

Bug #15 — Chat page (no history)

End of Bug Report — Cleya.ai

Cleya.ai Bug-solutions Report

Cleya.ai — Bug Solutions Report

Website: <https://cleya.ai/>

Date: 30 March 2026 | Total Bugs: 15

Priority: **High** | **Medium** | **Low**

Bug #1: Company Stage Dropdown — Options Not Visible [Priority: High]	
Issue	Dropdown options are invisible when opened — likely white text on white background.
Solutions	• Check and fix the dropdown option text color in CSS — ensure it contrasts with the dropdown background (e.g., dark text on light background or white text on dark background). • Test the component in both light and dark mode to ensure options are always readable. • Use browser DevTools to inspect the rendered <option> or custom dropdown items and fix any conflicting color overrides. • Add a fallback default style for dropdown items in the global stylesheet.

Bug #2: 'Other' Option in Industries — No Input Appears [Priority: Medium]	
Issue	Clicking 'Other' in the Industries section does not open any input field for custom entry.
Solutions	• Add a conditional text input or text field that appears below the options when 'Other' is selected. • Implement an onChange handler on the selection that toggles the visibility of a free-text input field. • Ensure the custom input value is captured and saved in the form state before submission. • Use a smooth CSS transition/animation so the input field appears naturally without jarring the layout.

Bug #3: Profile Completion Stuck at 88% [Priority: Medium]	
Issue	Profile progress bar shows 88% even after filling all visible fields, with no indication of what is missing.
Solutions	• Audit the profile completion scoring logic — identify all fields that contribute to 100% and ensure all are surfaced in the UI. • Display a checklist or tooltip showing exactly which fields are incomplete (e.g., 'Add your LinkedIn URL to reach 100%').

	• If optional fields are included in the completion score, consider either removing them or clearly marking them as optional. • Add a 'What's missing?' CTA near the progress bar that directs users to incomplete sections.
--	---

Bug #4: Match Recommendations Not Hyper-Niched [Priority: High]

Issue	Matches are irrelevant — user seeking marketing help was shown AI space partners and investors.
Solutions	• Revamp the matching algorithm to prioritize the user's stated primary goal (e.g., marketing, fundraising, hiring) as the top-weighted signal. • Introduce intent-based filtering: when a user says they want to 'boost marketing', only show profiles tagged with marketing expertise or growth roles. • Build a tagging/categorization system for all user profiles so matching is based on structured data, not free-text alone. • Implement a feedback loop — allow users to rate match quality so the algorithm can self-improve over time. • Consider a short onboarding quiz to capture matching preferences more precisely before showing results.

Bug #5: Matches Not Sorted by Fit Percentage [Priority: Medium]

Issue	Match cards are not displayed in descending order of fit score — lower scores appear before higher ones.
Solutions	• Sort match results by fit percentage in descending order before rendering on the frontend. • Add a default sort parameter to the API response (e.g., <code>sort_by=fit_score&order=desc</code>). • If custom sorting is offered, set 'Best Match' as the default sort option. • Add a visible sort/filter control on the matches page so users can re-sort if needed.

Bug #6: Pending Count Mismatch & No Request State Tracking [Priority: High]

Issue	Pending count shows 0 on Matches page but 3 on Dashboard. No visibility into request status stages.
Solutions	• Fix the state synchronization issue — ensure the pending count is pulled from a single shared data source (e.g., a global state store or API) and not computed independently on each page. • Implement real-time count updates using WebSockets or polling so the badge updates without a page reload.

	• Add a multi-stage status tracker for connection requests: 'Request Sent' → 'Viewed' → 'Accepted / Declined'. • Display the current stage visually on each match card (e.g., a status badge or timeline indicator). • Send in-app or email notifications when a request moves between stages.
--	--

Bug #7: 'Why Connect' Description is Vague [Priority: High]

Issue	The Why Connect section lacks meaningful profile details — no work history, funded companies, or background.
Solutions	• Auto-scrape LinkedIn profile data (with user consent) during onboarding to enrich match card details — past companies, current role, investment portfolio, etc. • Show structured sections on each match card: Past Companies, Key Skills, Noteworthy Achievements, Investment Thesis (for investors). • Use AI to generate a personalized, context-aware 'Why Connect' narrative based on both users' profiles rather than a generic template. • Allow users to manually fill in a highlights section (e.g., 'I've scaled 3 SaaS products to \$1M ARR') that appears on their match card. • Display mutual connections or shared context (same ecosystem, city, industry) as social proof on the card.

Bug #8: Chat with Cleya — Broken Markdown Formatting [Priority: Medium]

Issue	Markdown syntax like **bold** is rendered as plain text instead of being formatted.
Solutions	• Replace the plain text renderer in the chat component with a Markdown parser — use a library like react-markdown or marked.js. • Sanitize rendered HTML to prevent XSS vulnerabilities while allowing safe formatting tags (bold, italic, lists). • Test the chat output with all common Markdown patterns: bold, italic, bullet lists, numbered lists, and headers. • Apply consistent chat bubble styling so formatted content renders neatly within the message container.

Bug #9: Lengthy Onboarding Forms & No LinkedIn/CV Import [Priority: High]

Issue	Forms are too long for casual users; no option to import data from LinkedIn or CV to reduce friction.
Solutions	• Add a 'Continue with LinkedIn' option at the start of onboarding that auto-populates name, role, company, industry, and profile picture.

	• Offer CV/resume upload support — parse key fields (role, company, skills) automatically using a document parser. • Break the onboarding form into a progressive multi-step flow with a progress indicator so it feels less overwhelming. • Mark only the truly essential fields as required and defer optional fields to a 'Complete your profile' prompt post-signup. • Show estimated time to complete (e.g., 'Takes about 3 minutes') to set expectations upfront. • Save progress automatically so users can resume if they drop off.
--	---

Bug #10: Match Card Shows Insufficient Information [Priority: High]

Issue	Match cards show too little information — just a title and a vague one-liner — making it hard to judge fit.
Solutions	• Expand match cards to include: current role & company, past 2-3 notable companies or investments, a short bio, key skills/expertise tags, and location. • Add a 'View Full Profile' option that opens a detailed profile modal or page without leaving the matches view. • Pull LinkedIn data (with consent) to automatically enrich profiles at the point of display. • Show a brief AI-generated compatibility summary — specific reasons why this person matches the user's goals. • Include social proof elements like mutual connections, shared ecosystem activity, or verified credentials.

Bug #11: Generic AI-Generated Design — Lack of Unique Branding [Priority: Low]

Issue	The website uses a generic AI-built visual style that lacks distinctive branding and identity.
Solutions	• Define a unique design system: choose a distinctive primary color palette, a custom typeface pairing, and a consistent icon style that feels ownable. • Commission or design a custom logo that communicates the platform's positioning (e.g., connection, intelligence, trust). • Use micro-interactions and animations (hover effects, transitions) to make the UI feel crafted and intentional. • Introduce unique illustrative or visual elements — custom icons, illustrations, or data visualizations — that set the product apart. • Reference brand identity work from platforms with strong visual identities (e.g., Linear, Loom, Notion) as a benchmark. • Conduct a branding sprint with a designer to create a brand guidelines document before the next design iteration.

Bug #12: Onboarding Chat Flow Dead-End After Referral Question [Priority: High]

Issue	After answering 'How did you hear about Cleya?', the chat stops with no next step or transition.
Solutions	• Add a clear closing message and CTA after the last onboarding question (e.g., 'Great, you're all set! View your matches →'). • Automatically redirect users to the dashboard or matches page after onboarding is complete. • Show a completion animation or congratulations screen to signal the end of the onboarding flow. • Store the onboarding state server-side so re-opening the chat does not restart the flow from scratch. • Add a fallback catch-all message so the chat never truly goes silent — always guide the user to the next action.

Bug #13: LinkedIn URL Field — 'https://' Not Pre-filled [Priority: Low]

Issue	Users must manually type the full LinkedIn URL including 'https://', causing friction and input errors.
Solutions	• Pre-fill the LinkedIn input field with 'https://linkedin.com/in/' as a static prefix so users only type their handle. • Use an input addon/prefix UI pattern (common in design systems) to display the prefix visually but only capture the handle as the value. • Add client-side validation to check the entered URL format and show an inline error if the format is wrong. • Consider replacing the URL field entirely with a 'Connect LinkedIn' OAuth button for a zero-friction experience.

Bug #14: Matching Algorithm Relies on Limited Self-Reported Data [Priority: High]

Issue	Matches are coincidental due to thin data — the algorithm needs richer signals beyond form inputs.
Solutions	• Integrate LinkedIn scraping tools (e.g., Olostep, Firecrawl) to enrich user profiles with work history, connections, and activity data. • Build a reasoning-based search layer on top of raw data — use an LLM to evaluate profile compatibility beyond keyword matching. • Incorporate intent signals: what the user is looking for (marketing help, investment, co-founder) should heavily weight the match ranking. • Use graph-based matching to surface second-degree connections and warm introductions. • As the user base grows, apply collaborative filtering — users with similar profiles who connected successfully can guide future recommendations.

	• Add a feedback mechanism ('Was this match useful?') to gather labeled data for improving the model.
--	---

Bug #15: Multiple UI/Navigation Issues [Priority: Medium]	
Issue	Incomplete Hindi translation, missing footer, inconsistent navbar, and no chat history.
Solutions	• Hindi Translation: Use a proper i18n framework (e.g., i18next) and audit all UI strings to ensure full translation coverage. Add a QA pass by a native Hindi speaker. • Footer: Add a consistent footer to all authenticated pages with links to key sections, legal pages (Privacy Policy, Terms), and support. • Navbar: Implement a persistent, responsive navbar across all inner pages with links to Matches, Profile, Chat, and Settings. • Chat History: Persist chat messages to the database and load conversation history on each session open. Use a unique session ID per user to retrieve prior messages. • Consider a breadcrumb or back-navigation component on inner pages to improve orientation within the app.

Priority Summary

Bug	Priority	Effort
#1 — Dropdown options not visible	High	Low
#2 — 'Other' no input popup	Medium	Low
#3 — Profile stuck at 88%	Medium	Low
#4 — Irrelevant match recommendations	High	High
#5 — Matches not sorted by fit %	Medium	Low
#6 — Pending count mismatch & no status tracking	High	Medium
#7 — Vague 'Why Connect' description	High	High
#8 — Broken markdown in chat	Medium	Low
#9 — Lengthy forms, no LinkedIn import	High	Medium
#10 — Insufficient match card info	High	Medium
#11 — Generic AI design	Low	High
#12 — Onboarding chat dead-end	High	Low

#13 — LinkedIn URL not pre-filled	Low	Low
#14 — Weak matching algorithm	High	High
#15 — UI/Nav issues (translation, footer, navbar, history)	Medium	Medium

Display & UI — headings, body, labels

Geometric humanist, variable weight. Excellent legibility at small sizes. Free on Google Fonts. Pairs well with Devanagari for Hindi.

DM Mono

Data & Metadata only

Used only for: match scores (94%), dates, handles. Contrast between sans and mono creates instant hierarchy between labels and values.

Style	Size / Weight	Used For
Display	40px 500	Hero headline only
Heading 1	32px 600	Page titles
Heading 2	24px 600	Section & panel headers
Body	14px 400	General UI text
Label	11px 600 CAPS	Nav items, field labels
Mono	13px 400	Scores, handles, dates (DM Mono)

Component design

Navigation bar

- Height: 52px. Background: `rgba(255,255,255,0.03)`. Bottom border: 1px solid `rgba(255,255,255,0.06)`.
- Logo: 28px rounded mark in `#6C63FF` + "Cleya" wordmark in white.
- Nav links: 13px, `rgba(255,255,255,0.45)` default, white + bg `rgba(255,255,255,0.08)` on active.
- Right side: bell icon with teal dot badge, avatar with gradient fill.

Sidebar (dashboard)

- Width 200px. Background `rgba(255,255,255,0.02)`. Section labels 9px uppercase, `rgba(255,255,255,0.25)`.
- Active item: background `rgba(108,99,255,0.15)`, text `#9B95FF`.
- Unread count: small pill with `#6C63FF` background.

Match cards

- Background `rgba(255,255,255,0.04)`, 1px border `rgba(255,255,255,0.08)`, border-radius 12px.
- Avatar: 52px rounded square with gradient. Name 17px weight 500.
- Fit score bar: gradient fill `#6C63FF` → `#4ECDC4` on a 5px track.
- "Why connect" block: `rgba(108,99,255,0.08)` background with violet border. Personalised AI paragraph.
- Past companies shown as chip pills. Actions: full-width Connect (violet) + Pass (ghost).

Buttons

- Primary: background #6C63FF, white text, 10px radius, padding 10px 22px.
- Ghost: rgba(255,255,255,0.06) bg, rgba(255,255,255,0.7) text, 1px border.
- Destructive/pass: rgba(255,255,255,0.05) bg, muted text.

UX improvements for this direction

- Onboarding: 3-step stepper replaces single long form. LinkedIn OAuth import auto-fills fields.
- Match ranking: sorted by fit % descending. Score bar visible on every card.
- Request status: 3-step timeline (Sent → Viewed → Accepted/Declined) on each match.
- Chat: Markdown rendered via react-markdown. Full conversation history persisted.
- Profile completion: ring shows %, with inline nudge listing missing fields.
- Footer: added to all authenticated pages with nav links + legal links.
- Dropdown fix: explicit text-colour override — white text on all option elements.
